

Project 1

Name: Raudat's Investing & Finance

Topic:

This website's main goal and basis will be to create an investing website to aid in my personal trades and banking profile. I am basing the website on my experience using the Bloomberg terminal. I plan on adding real-time securities data from something like Yahoo Finance and having basic graphs and information like market cap and what type of securities is listed. A login page will bring the user to their portfolio or watchlist that will have securities tickers and such to view the price and volume traded. The last page will have regulatory information and such.

Pages:

Home: Base directory to get to the login page and will have some preloaded news

Login: User login page to load their watchlist

Portfolio/watchlist: Securities added to list and news will be pulled as well as prices

Security 1 on the list: self explanatory

Information and regulatory: states this is a working prototype and not registered with the FDIC or FINRA etc

Data:

The data that will be stored will be user accounts, the prices of securities, the tickers they add, the securities the user adds to their list, as well as the charts/data behind each security they add ie the volume traded, the market cap, the 52-week high and low etc.
